 LANGUAGE:
      A review with 56 refs. Tick-borne spirochetes include borreliae that cause Lyme disease and relapsing fever in humans. They survive in a
      triangle of parasitic interactions between the spirochete and its
      vertebrate host, the spirochete and its tick vector, and the host and the
      tick. Until recently, the significance of vector-host interactions in the
      transmission of arthropod-borne disease agents has been overlooked.
      However, there is now compelling evidence that the pharmacol. activity of
      tick saliva can have a profound effect on pathogen transmission both from
      infected tick to uninfected host, and from infected host to uninfected tick. The salivary glands of ticks provide a pharmacopoeia of
      anti-inflammatory, anti-hemostatic and anti-immune mols. These include
      bioactive proteins that control histamine, bind Igs, and inhibit the
      alternative complement cascade. The effect of these mols. is to provide a privileged site at the tick-host interface in which borreliae and other
      tick-borne pathogens are sheltered from the normal innate and acquired
      host immune mechanisms that combat infections. Understanding the key
      events at the tick vector-host interface, that promote spirochete
      infection and transmission, will provide a better understanding of the
      epidemiol. and ecol. of these important human pathogens.

RNA interference (RNAi), a gene silencing process, has been recently exploited to det. gene function by degrading specific mRNAs in several eukaryotic organisms. We constructed a double stranded RNA (dsRNA) from a previously cloned putative Amblyomma americanum histamine binding protein (HBP) to test the significance of using this methodol. in the assessment of the function and importance of gene products in ectoparasitic ticks. The female salivary glands incubated in vitro with HBP dsRNA had a significantly lower histamine binding ability. In addn., the injection of HBP dsRNA into the unfed females led both to a reduced histamine binding ability in the isolated salivary glands and to an aberrant tick feeding pattern or host response. Mol. data demonstrated less expression of the HBP mRNA in the RNAi group. Taken together, these results suggest that RNAi might be an important tool for assessing the significance of tick salivary gland secreted proteins modulating responses at the tick-host interface.

DOCUMENT TYPE: Journal LANGUAGE: English

Genes expressed differentially in the salivary glands of unfed and fed male ticks, Amblyomma americanum (L.), were identified, cloned and sequenced, and some were compared with those expressed in the salivary glands of Dermacentor andersoni. Total protein and RNA increased sixfold in the salivary glands of fed male A. americanum, while in fed male D. andersoni salivary glands, RNA increased approx. 3.5 times. Feeding D. andersoni in the presence of females increased total RNA by 25% over those fed in the absence of females. Complementary DNAs were synthesized from RNA obtained from unfed and fed ticks and amplified using RNA arbitrarily primed polymerase chain reaction (RAP-PCR) with three different primers in sep. reactions. Differential display showed clear banding differences between the fed and the unfed ticks in A. americanum and D. andersoni. Sixty-one cDNA fragments that appeared to be from differentially expressed genes in A. americanum were isolated, cloned and sequenced. Hybridization reactions with labeled cDNA probes confirmed the differential expression of many of the genes in unfed and fed ticks' salivary glands; however, many of the bands contained more than one fragment and some of the fragments isolated from apparently differential bands were not specific. Sequences for 28 of the cDNA fragments (150-600 nucleotides in length) demonstrated similarity to genes in the databases, but nine of these were similar to sequences of unknown function. Some of the gene fragments identified may be important to tick feeding or tick salivary gland physiol., including a histamine-binding protein, an org. ion transporter, an apoptosis inhibitor, a cathepsin-B-like cysteine protease, proteins involved in gene regulation and several proteins involved in protein synthesis. Cross-hybridization of identified cDNAs from A. americanum with cDNA probes synthesized from D. andersoni total RNA did not show significant similarity between the two species.

C.; Slovak, M.; Nuttall, AUTHOR(S): P. A. CEH Oxford, Oxford, OX1 3SR, UK CORPORATE SOURCE: Insect Molecular Biology (2002), 11(1), 79-86 SOURCE: CODEN: IMBIE3; ISSN: 0962-1075 PUBLISHER: Blackwell Publishing Ltd. DOCUMENT TYPE: Journal English LANGUAGE: To overcome the inflammatory response in its host, the cattle-feeding, brown ear tick secretes histamine-binding proteins into the feeding site. These proteins are .beta.-barrels
with 2 internal binding sites: a high-affinity (H) site for histamine and a site (L) for which the natural ligand is unknown. Here we report a related protein (SHBP), secreted by a rodent- and cattle-feeding tick, that traps both histamine and serotonin. The histamine-binding H site is well conserved in SHBP, whereas residue changes in the L-like site are consistent with binding of the bulkier serotonin mol. As histamine is a key inflammatory mediator in cattle, while serotonin takes on this role in rodents, the diversification of these tick proteins may reflect host adaptation. 12-1 (Nonmammalian Biochemistry) Section cross-reference(s): 3, 6 Dermacentor saliva serotonin histamine binding lipocalin sequence ST Dermacentor reticulatus IT Feeding Protein sequences Saliva cDNA sequences (high affinity serotonin- and histamine-binding lipocalin sequence and identification from tick saliva) IT RL: BSU (Biological study, unclassified); PRP (Properties); BIOL (Biological study) (lipocalin; high affinity serotonin- and histamine-binding lipocalin sequence and identification from tick saliva) 426310-26-1, Lipocalin (Dermacentor reticulatus) RL: BSU (Biological study, unclassified); PRP (Properties); BIOL (Biological study) (amino acid sequence; high affinity serotonin- and histamine-binding lipocalin sequence and identification from tick saliva) 50-67-9, Serotonin, biological studies 51-45-6, Histamine, biological IT studies RL: BSU (Biological study, unclassified); BIOL (Biological study) (high affinity serotonin- and histamine-binding lipocalin sequence and

AB The invention relates to the discovery that various proteins isolated from ticks are effective in the treatment and prevention of allergic rhinitis. These proteins may most suitably be applied to an effected area and are thus effective to treat this condition and to ameliorate its symptoms. Human subjects were challenged with histamine and then were treated with histamine-binding protein, MS-HBP1.

Institute of Virology and Environmental Microbiology, CORPORATE SOURCE: Natural Environment Research Council, Oxford, OX1 3SR, Molecular Cell (1999), 3(5), 661-671 SOURCE: CODEN: MOCEFL; ISSN: 1097-2765 Cell Press **PUBLISHER:** Journal DOCUMENT TYPE: English LANGUAGE: High-affinity histamine-binding proteins (HBPs) were discovered in the saliva of Rhipicephalus appendiculatus ticks. Their ability to outcompete histamine receptors indicates that they suppress inflammation during blood feeding. The crystal structure of a histamine-bound HBP, detd. at 1.25 .ANG. resoln., reveals a lipocalin fold novel in contg. two binding sites for the same ligand. The sites are orthogonally arranged and highly rigid and form an internal surface of unusual polar character that complements the physicochem. properties of histamine. As sol. receptors of histamine, HBPs offer a new strategy for controlling histamine-based diseases. 200220-32-2 200220-33-3 200220-34-4 IT RL: PRP (Properties) (amino acid sequence; isolation, cloning, mol. characterization and three-dimensional structure of sex-specific tick histamine-binding proteins) 200220-32-2 HCAPLUS CN Protein FS-HBP1 (Rhipicephalus appendiculatus female-specific histamine-binding) (9CI) (CA INDEX NAME) \*\*\* STRUCTURE DIAGRAM IS NOT AVAILABLE \*\*\* RN 200220-33-3 HCAPLUS Protein FS-HBP2 (Rhipicephalus appendiculatus female-specific CN histamine-binding) (9CI) (CA INDEX NAME) \*\*\* STRUCTURE DIAGRAM IS NOT AVAILABLE \*\*\*

T2 NZ 504753 20021126 NZ 1998-504753 19981126 Α PRIORITY APPLN. INFO.: GB 1997-25046 A 19971126 GB 1998-13917 Α 19980626 WO 1998-GB3530 W 19981126 The present invention relates to histamine and serotonin binding mols. ΑB that possess a binding site with the precise mol. configuration that is necessary to confer on the mol. a high affinity for histamine. The invention includes proteins, peptides and chem. compds. that possess this mol. configuration and that are thus able to bind to histamine with high affinity. These mols. may be used in the regulation of the action of histamine or serotonin, the detection and quantification or histamine or serotonin and in the treatment of various diseases and allergies. The mols. may also be used as components of vaccines directed against blood-sucking ectoparasites. Vasoactive amine binding proteins (VABPs) are provided that specifically bind to vasoactive amines with a dissocn. const. of <10-7 M and which belong to the same protein family as MS-HBP1, FS-HBP1, FS-HBP2 and D.RET6. Thus, 11 VASPs were isolated, and their cDNAs cloned and sequenced, from ticks: FS-HBP1 (female-specific histamine-binding protein 1), FS-HBP2 (female-specific histamine-binding protein 2), MS-HBP1 (male-specific histaminebinding protein 1), and Ra-Res from Rhipicephalus appendiculatus; D.RET6 from Dermacenter reticularis; Av-HBP from Amblyomma variegatum; and 5 related Ih/Bm-HBP

proteins from a mixed Ixodes hexagonus/Boophilus microplus cDNA expression

library. These VASPs possess similar amino acid sequences and predicted secondary structures. The VASPs bind histamine in mammals, and can be used as anti-inflammatory agents to regulate histamine action and to control its pathol. effects. The crystal structure of FS-HBP2 to 2.24 .ANG. resoln. was used to design a synthetic cyclic octapeptide ('Ala-Glu-Ala-Phe-Ala-Glu-Ala-Trp-) with histamine binding activity. 200220-32-2 200220-33-3 200220-34-4 200220-35-5 226891-31-2 226891-34-5 226891-36-7 226891-37-8 226891-38-9 226891-39-0 226891-40-3 RL: BAC (Biological activity or effector, except adverse); BPR (Biological process); BSU (Biological study, unclassified); PRP (Properties); THU

     Vasoactive amine binding proteins (VABPs) are provided that specifically
AΒ
     bind to vasoactive amines with a dissocn. const. of <10-7 M and which
```

belong to the same protein family as MS-HBP1,

```
FS-HBP1, FS-HBP2 and D.
    RET6. Thus, 4 VASPs were isolated, and their cDNAs cloned and
    sequenced, from ticks: FS-HBP1 (female-specific
    histamine-binding protein 1),
    FS-HBP2 (female-specific histamine-
    binding protein 2), and MS-
    HBP1 (male-specific histamine-binding
    protein 1) from Rhipicephalus appendiculatus; and
    D.RET6 from Dermacenter reticularis. These 4 VASPs
    possess similar amino acid sequences and predicted secondary structures.
    The VASPs bind histamine in mammals, and can be used as anti-inflammatory
    agents to regulate histamine action and to control its pathol. effects.

A review, with 53 refs. Recent gene sequence and crystal structure detns. of salivary proteins from several blood-sucking arthropods have revealed an unusual evolutionary relationship: many such proteins derive their functions from lipocalin protein folds. Many blood-sucking arthropods have independently evolved the ability to overcome a host organism's means of preventing blood loss (called hemostasis). Most blood feeders have proteins that induce vasodilation, inhibit blood coagulation, and reduce inflammation, but do so by distinctly different mechanisms. Despite this diversity, in many cases the antihemostatic activities in such organisms reside in proteins with lipocalin folds. Thirteen such lipocalins are described in this review, with a particular focus on the heme-contg. nitrophorins from R. prolixus, which transport nitric oxide, sequester histamine, and disrupt blood coagulation. Also described are the anti-platelet compds. RPAI, moubatin, and pallidipin from R. prolixus, Ornithodoros moubata, and Triatoma pallidipennis; the antithrombin protein triabin from T. pallidipennis; and the tick histamine binding proteins from Rhipicephalus appendiculatus.

AB A review, with 26 refs. Tick histamine-binding

proteins (HBPs) are lipocalins with 2 binding pockets. One of these binds histamine with a high affinity and is found at the position expected from other lipocalins, adjacent to the .OMEGA.-loop at the open-end of the .beta.-barrel. A 2nd binding cavity, which is a low-affinity site for histamine in 1 of the HBPs, is located at the end of the barrel that is closed off in other lipocalins. To create the 2nd site, the closed-end region has undergone a major reconstruction. Typical lipocalin characteristics, such as the 310 helix and a structural cluster of highly conserved residues, have been lost, while an .alpha.-helix now shields the cavity from the exterior. The prominence of acidic residues

in the binding pockets is another distinctive characteristic of HBPs. Whereas most lipocalins have highly hydrophobic binding cavities designed to bind lipophilic compds., HBPs have evolved to trap cationic,

hydrophilic mols.

Enalish

Histamine is released from mast cells and basophils by either immunol. or nonimmunol. mechanisms. Histamine, which is the most potent short acting mediator released from these cells, exerts its diverse biol. actions by binding to cell surface histamine receptors. The authors report the affinity purifn. of histamine receptor proteins from Triton X-100 solubilized peripheral human blood mononuclear cells which include lymphocytes and monocytes. Three different designs of histamine affinity columns were constructed; all three resulted in the same material being eluted. This consisted of bands which on SDS-PAGE after boiling and redn. had the following mol. wts.: 193K, 84K, 58K, 48K, 37K, and 16K. The most abundant bands were of mol. wts. 193K, 48K, and 16K, and these were disulfide bonded together to form a high mol. wt. complex. The 58K band was present in lower amts. than the others, and in only a few fractions. It had the same mol. wt. as the dimeric form of histamine methyltransferase which is present in small amts. in mononuclear cells and may therefore have copurified. The histamine binding proteins described in this report were purified by conventional affinity chromatog., rather than by an expression cloning approach which obviates the use of any protein chem. Consequently, the authors had the advantage of being able to verify the histamine binding specificity of the purified proteins directly and with several independent assays as follows. The histamine binding specificity of all three columns was established by specific elution with histamine, by preabsorption of crude cell ext. with excess free histamine prior to column application, and by comparison with control columns. Independent detn. of the binding specificity, using a radioreceptor dot blot assay, of the eluate contg. only the 193K, 48K, and 16K disulfide-linked subunits confirmed that the purified material bound specifically to [3H]histamine and that a 300-500-fold degree of purifn. from tissue ext. had been obtained. Following cell surface radioreceptor crosslinking of radiolabeled histamine to intact mononuclear cells, the 16K band was detected, indicating it to be the ligand-binding subunit for histamine. These same three proteins were purified from T lymphocyte and monocytoid cell lines, indicating that both lymphocyte and monocyte subsets of mononuclear cells express these proteins. The trimol. structure, consisting of 193K, 48K, and 16K subunits appears to be a novel histamine cell surface receptor protein complex as the mol. wts. of the 193K, 48K, and 16K bands bore no relation to the predicted mol. wts. of the recently expression cloned H1 receptor gene derived from bovine adrenal and H2 receptor gene derived from human parietal cells; this may reflect receptor heterogeneity within a tissue, between tissues, and/or between species.

     Human serum proteins were bound on and eluted from Sepharose-polylysine-
     histamine column. Thus obtained protein fraction was referred to as HBP (
     histamine-binding protein). HBPs were examd.
     for the ability to bind histamine by biol. method applied to isolated
     guinea pig intestine. Chromatog. sepns. were run on DEAE cellulose column
     to obtain HBPs which are directly responsible for histamine-binding
```

```
activity. The results suggest that human serum contains 3 HBP fractions.
     One of them was identified as orosomucoid, and the 2 remaining ones seem
     to be glycoproteins belonging to .alpha.1 globulin group.

     Serum histamine (I)-binding proteins (HBP) were isolated by affinity
     chromatog. on polylysine-Sepharose 4B-immobilized histamine (II) and
     characterized by electrophoresis. Dialyzed serum proteins were incubated
     with a suspension of carrier II for 2 h at 37.degree., and the carrier
     then was packed in a column, washed with 0.9% NaCl to remove unbound
     proteins, and eluted with 0.2M EDTA and 6M urea to remove HBP.
     Polyacrylamide gel electrophoresis in the presence of 0.2% Na dodecyl
     sulfate sepd. 8 HBP fractions with mol. wts. in the range 80,000-350,000.
     A bioassay with isolated guinea pig intestine was used to det. I and to
     study its inactivation at various HBP concns.

     In 50 adult patients with tuberculosis and nonspecific endobronchitis, the
     blood levels of histamine and serotonin increased and those of
     histamine-binding protein decreased 2-, 1.5-
     and 5-fold, resp., in the patients without microflora in the bronchi and
     1.4-, 1.5-, and 2-fold, resp., in the patients with addnl. microflora in the bronchi as compared with those of normal subjects. After treatment with antibiotics and antihistamines or corticosteroids, the levels usually
     normalized.

     Gel chromatog, of normal human serum on a histamine-fixed. CNBr-activated
     Sepharose 4B column adsorbed the histaminoplexic compd. of the serum.
     Elution with 6M quanidine-HCl yielded a protein (max. uv absorbance at280
     nm). Na dodecyl sulfate-polyacrylamide gel electrophoresis showed only 2
     bands. Thus, the presence of a histamine-binding
     protein in blood serum is confirmed.

AB The mechanism of formation and release of histaminopexic peptide was studied in the rat. Detns. were carried out with plasma and serum which were first subjected to gel filtration on Sephadex G-25. Agarose gel electrophoresis was used to sep. polypeptides, and free histamine (I) was assayed with an atropinized guinea pig ileum suspended in Tyrode's soln. Whereas I-binding activity of plasma was in the protein fraction, in serum it was in the peptide region; after papain digestion, results with plasma were similar to those with serum. Adrenalectomy caused loss of I-binding activity, unless rats were treated with prednisolone succinate. The I-binding peptide probably released from albumin by a papainlike action during blood coagulation. Adrenal cortex function is needed for maintenance of I-binding activity.

AB Expts. performed on serum from healthy adult humans indicated that the albumin fraction in some way binds histamine, whereas all other fractions of the plasma were lacking in such activity. When the fraction contg. 96% of albumin was digested with papain, and then passed through Sephadex G-25, the histamine-binding activity moved to the polypeptide region of the plasma. All the low-mol.-wt. polypeptide portion had been released from the albumin during coagulation, or by papain digestion. Plasma albumin or serum peptide from blood of 8 allergic patients (generalized dermatoses) lacked histamine-binding activity, indicating that lack of a histaminopexic substance may be involved in the pathogenesis of allergic diseases.

Rome, Rome, Italy Biochimica et Biophysica Acta (1968), 154(2), 360-6 SOURCE: CODEN: BBACAQ; ISSN: 0006-3002 DOCUMENT TYPE: Journal English LANGUAGE: The specific interaction between bovine serum albumin and histamine and the influence of the ionic medium on this interaction were studied. This interaction is dependent on ionic strength. Evidence is given for a crit. saline concn. which can be regarded as a threshold defining 2 sharply different behaviors of bovine serum albumin in the presence of histamine. Potentiometric measurements carried out by means of coupled perm-selective membrane electrodes provided data which showed that for a given ionic strength, bovine serum albumin requires an amt. of histamine which varies with the nature of the cations. Alkali binding to the bovine serum albumin macroion in the presence of histamine does not follow the sequence expected for polycarboxylic acids, since K+ proved to be the most tightly bound. 20 references. 2 (General Biochemistry) CC BINDING: HISTAMINE BINDING PROTEINS; ELECTROLYTES ALBUMINS HISTAMINE; CATIONS ALBUMINS HISTAMINE BINDING; ALBUMINS HISTAMINE BINDING; PROTEINS HISTAMINE BINDING Cations, biological studies IT (in histamine reaction with albumins) Albumins, blood serum IT RL: RCT (Reactant); RACT (Reactant or reagent) (reaction of, with histamine, cation binding effect on) 51-45-6, reactions IT RL: RCT (Reactant): RACT (Reactant or reagent) (with albumin, cation binding effect on)

                                                                                                                                                                                  This protein comprises tick Rhipicephalus appendiculatus (Ra) novel female-specific histamine binding protein 1 (FS-HBP1). Its amino acid sequence was deduced from a cDNA clone (see AAV00227) obtained from a salivary gland cDNA library. FS-HSP2 and male-specific HSP1 (see AAW37447-48) and a related protein, D.RET6 (see AAW37449) from Dermacenter reticularis, were also identified. These novel vasoactive amine binding proteins (VABP8) can be expressed in host cells using e.g. a baculovirus expression system. They can be used: (i) to assay histamine (or other VA such as serotonin) in the contraction of the contractio
                                                                  body fluids or cell culture supernatants, e.g. to monitor the effect of allergens; (ii) for binding VA, e.g. to remove histamine from blood, food, cell cultures etc.; (iii) as an antihistamine or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        metazoan
studying
                 This sequence is an example of a histamine or serotonin binding compound (A), of the invention. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and altergies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Histamine binding protein; serotonin binding compound; inflammation; gastric acid secretion; allergy; type I hypersensitivity reaction; asthma; urticaria; allergic rininitis; food dermatitis; food allergy; drug allergy; abnormal blood pressure; psychological disorder; vaccine respiratory disease; coronary heart disease; cellular growth regulator tissue repair; blood-sucking ectoparasite; therapy.

They may e more effective and safer than conventional antihistamines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for treating or preventing allergic rhinitis. The method involves employing a blood-feeding ectoparasite-derived (e.g. tick-derived) histacalin protein. The presequence is one such histacalin protein. The histacalin protein, is useful for treating or preventing allergic rhinitis, both seasonal and protein of the presequence is the seasonal and the protein of the presenting allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of histacalin proteins for treating or preventing allergic rhinitis, or for manufacturing a medicament for treating or preventing allergic rhinitis, e.g. seasonal or perennial allergic rhinitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

AAW37447
                           This protein comprises tick Rhipicephalus appendiculatus (Ra) novel CC female-specific histamine binding protein 2 (FS-HBP2). Its amino acid sequence was deduced from a cDNA clone (see AAW0728) obtained CC from a salivary gland cDNA library. FS-HSP1 (see AAW37446) and male-specific HSP1 (see AAW37448) and a related protein, D.RE76 (see CC AAW37449) from Dermacenter reticularis, were also identified. These convel vasoactive amine binding proteins (VABPs) can be expressed in bost cells using e.g. a baculovirus expression system. They can be used; (i) to assay histamine (or other VA such as serotonin) in be used; (i) to assay histamine (or other VA such as serotonin) in comparation or cell culture supernatants, e.g. to monitor the body fluids or cell cultures stor; (iii) as an antihistamine or ceffect of allergens; (ii) for binding VA, e.g. to remove histamine constructions blood, food, cell cultures etc.; (iii) as an antihistamine or anti-inflammatory agents, e.g. for treating insect, snake or scorpion bites or dermatitis, or as a carrier for slow release of histamine-related compounds; (iv) in vaccines to protect against metazoan parasites, especially in animals; (v) as reagents for the immune response etc. VABPs provide a more sensitive assay for histamine than low-affinity antibodies currently used. They may calso be more effective and safer than conventional antihistamines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      assaying or removing histamine and as antihistamine or anti-inflammatory agents

                                                                                                                                                                                                                                                          This sequence is an example of a histamine or serotonin binding compound (A), of the invention. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various dibleases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergic rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease). Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of vaccines directed against blood-sucking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Histamine binding protein; serotonin binding compound; inflammation; gastric acid secretion; allergy; type I hypersensitivity reaction; asthma; urticaria; allergic rhinitis; atopic dermatitis; food allergy; droormal blood pressure; psychological disorder; vaccine; respiratory disease; coronary heart disease; cellular growth regulator; tissue repair; blood-sucking ectoparasite; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for treating or preventing allergic rhinitis. The method involves employing a blood-feeding ectoparasite-derived (e.g. tick-derived) histacalin protein. The presensequence is one such histacalin protein. The histacalin protein, is useful for treating or preventing allergic rhinitis, both seasonal and perennial allergic conjunctivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of histacalin proteins for treating or preventing allergic rhinitis, or for manufacturing a medicament for treating or preventing allergic rhinitis, e.g. seasonal or perennial allergic rhinitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein comprises tick Rhipicephalus appendiculatus (Ra) novel male-specific histamine binding protein (MS-HBP1). Its amino acid sequence was deduced from a cDNA clone (see AAV00227) obtained from a salivary gland cDNA library. Female-specific HSP1 and the specific HSP1 and the specific HSP1 and the specific HSP2 (see AAW37446-47) and a related protein. D.RETG (see AAW37449) from Dermacenter reticularis, were also identified. These novel vasoactive anine binding proteins (VABPs) can be expressed in the specific HSP1 and the specific HSP2 (see AAW37449) to vasoactive anine be because in the specific HSP2 (see AAW37449) to specific HSP2 (see AAW37449) to vasoactive anine because in the specific HSP2 (see AAW37449) to vasoactive anine or assertion to the specific HSP2 (see AAW37449) to vasoactive minimum the specific HSP2 (see AAW37449) to vasoactive minimum the specific HSP2 (see AAW37449) to vasoactive minimum the specific HSP2 (see AAW37449) to vasoactive HSP2 (see AAW37449) to vasoactive minimum the specific HSP2 (see AAW37449) to vasoactive minimum the specific HSP2 (see AAW37449) to vasoactive minimum the specific HSP2 (see AAW37449) to vasoactive HSP2 (see AAW37449) to vas

                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                              This sequence is an example of a histamine or serotonin binding compound (A), of the invention. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticarial asthma, allergic rhinitis (hay fever), acopic dermatitis, insect bices and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease) Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of vaccines directed against blood-sucking ectoparasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gastric acid secretion; allergy; type I hypersensitivity reaction; asthma; urticaria; allergic rhinitis; atopic dermatitis; food allergy; drug allergy; abnormal blood pressure; psychological disorder; vaccine; respiratory disease; coronary heart disease; cellular growth regulator; tissue repair; blood-sucking ectoparasite; therapy.

cultures etc.; (iii) as an antinistantine of agents, e.g. for treating insect, snake or scorpion bites or agents, e.g. for treating insect, snake or scorpion bites or dermatitis, or as a carrier for slow release of histamine-related compounds; (iv) in vaccines to protect against metazoan parasites, especially in animals; (v) as reagents for studying inflammation, involvement of VA in ulcer formation or the immune response etc. VABPs provide a more sensitive assay for histamine than low-affinity antibodies currently used. They may also be more effective and safer than conventional antihistamines.
                                                                                                                                                                        This protein comprises tick Dermacenter reticularis (Dr) novel vasoactive amine binding protein (VABP) D.RF%. Its amino acid sequence was deduced from a cDNA clone (see AAV00230) obtained from a Dr salivary gland cDNA library. 3 Novel VASPs, designated from a Dr salivary gland cDNA library. 3 Novel VASPs, designated FS-HBP1, FS-HBP2 and MS-HBP1 (see AAW37446-48), of the tick Rhipicephalus appendiculatus have also been identified. The VABPs can be expressed in host cells using e.g. a baculovirus expression system. They can be used: (1) to assay histamine (or other VA such as serotonin) in body fluids or cell culture supernatants, e.g. to monitor the effect of allergens; (11) for binding VA, e.g. to remove histamine from blood, food, cell cultures etc.; (11) as an antihistamine or anti-inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New vasoactive amine binding proteins and related nucleic vectors - transformed cells and transgenic animals, used f assaying or removing histamine and as antihistamine or anti-inflammatory agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is an example of a histamine or serotonin binding compound (A), of the invention. The compounds are usseful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergic rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders,
                                                                                                                                                                                                                                                                                                                                                                               respiratory disease, and coronary heart disease). Histamine may also used to regulate cellular growth and tissue repair. The molecules may also be used as components of vaccines directed against blood-sucking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Histamine binding protein; serotonin binding compound; inflammation; gastric acid secretion; allergy; type I hypersensitivity reaction; asthma; urticaria; allergic rhinitis; allergic dermatitis; food allergy; drug allergy; abnormal blood pressure; psychological disorder; vaccine; respiratory disease; coronary heart disease; cellular growth regulator; tissue repair; blood-sucking ectoparasite; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                         CC This sequence is an example of a histamine or serotonin binding CC compound (A), of the invention. cDNA encoding this sequence was isolated from a mixed Boophilus microplus/Ixodes hexagonus cDNA expression CC library. The compounds are useful for regulating the action of histamine C1 and serotonin (in e.g. inflammation and gastric acid secretion), the C2 detection, quantification and removal of histamine or serotonin (in C1 animals, plants, cell cultures, food materials, or humans) and in the C2 treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergie repairs (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and C2 coronary heart disease). Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of coronary disease of the collection of the collecti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Histamine binding protein; serotonin binding compound; inflammation; gastric acid secretion; allergy; type I hypersensitivity reaction; asthma; urticaria; allergic rhinitis; atopic dermatitis; food allergy; drug allergy; abnormal blood pressure; psychological disorder; vaccine; respiratory disease; coronary heart disease; cellular growth regulator;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
